SUMMARY

DevOps Engineer with 1+ year of enterprise experience building CI/CD automation, managing artifact repositories, **securing DevOps tooling**, and deploying applications to Kubernetes and on-premise infrastructure. Hands-on expertise with **JFrog Artifactory**, **GitHub Actions**, **Docker**, **Maven**, and **GKE** at a Tier-1 banking organization. Migrated 600+ repositories to GitHub Enterprise Cloud, enabled enterprise security features, and modernized legacy pipelines across hybrid cloud environments.

EXPERIENCE

DevOps Engineer — *Australia and New Zealand Banking Group (ANZ)* Jul 2025 – Present

- Designed and maintained **GitHub Actions CI/CD pipelines** for end-to-end build, test, artifact publishing, and deployment workflows across multiple application services in a regulated enterprise environment.
- Built automated build pipelines for **Java Maven projects** producing WAR artifacts, and **Docker image builds**, with integrated publishing to **Enterprise JFrog Artifactory** for centralized binary and container image management.
- Deployed containerized applications to **Google Kubernetes Engine (GKE)** on GCP and to **on-premise Windows servers**, implementing secure deployment workflows with CDAP authentication, workload identity federation, service account impersonation, and automated `kubectl` rollout validation.
- Spearheaded the migration of **600+ mission-critical repositories** from GitHub Enterprise Server (GHES) to GitHub Enterprise Cloud (GHEC) across **9 engineering squads**, building Bash and **GitHub REST API** automation for validation, governance enforcement, and enterprise repository standardization.
- Enabled and enforced **GitHub Secret Scanning, Dependabot alerts, and push protection** across enterprise repositories, automating security feature enablement at scale through Git Bash and GitHub REST APIs to strengthen organization-wide **security hardening and governance**.
- Modernized legacy **Codefresh and uDeploy** pipelines by architecting reusable, config-driven GitHub Actions workflows with externalized `.config` files for environment-specific deployments across DEV, SIT, QA, and PROD for AU & NZ regions.
- Collaborated with platform engineering teams to **troubleshoot CI/CD failures**, resolve deployment blockers, configure corporate proxy settings (Alpaca), and debug build and infrastructure issues across **Linux and Windows** environments using Bash, PowerShell, and Git CLI.

Student Intern — *Continental Autonomous Mobility* Aug 2024 – Nov 2024

- Designed and developed a **security requirements management dashboard** using Python and Power BI for automotive software teams, enabling centralized tracking, visualization, and filtering by category, priority, and module.
- Conducted comparative performance analysis of **AES and RSA** cryptographic algorithms, benchmarking encryption throughput, key generation latency, and memory footprint for resource-constrained embedded systems.

TECHNICAL SKILLS

CI/CD & DevOps:	GitHub Actions, JFrog Artifactory, Codefresh, uDeploy, Maven, Docker, GitHub Enterprise (GHES/GHEC)
Cloud & Infra:	GCP (GKE, Workload Identity), AWS, Kubernetes, kubectl, On-Premise Windows Server Deployments
Scripting:	Bash, PowerShell, Python, Java, SQL, C/C++, JavaScript (ES6+)
Security & Tools:	GitHub Secret Scanning, Dependabot, Black Duck, Checkmarx, Twistlock, Git, GitHub REST API, Linux/Shell, ServiceNow

EDUCATION

B.Tech in Computer Science & Engineering (Cyber Security) Oct 2021 – Jun 2025
Dayananda Sagar University, Bengaluru **GPA: 8.96 / 10**

PUBLICATION

"Deepfake Image Content Detections using AI Algorithms" — *IEEE* Mar 2026
Co-authored peer-reviewed survey evaluating spatial and temporal feature extraction methodologies for deepfake detection, proposing hybrid CNN + EfficientNet + ResNet architectures for improved detection robustness.

PROJECTS

Advanced Deepfake Detection System — Hybrid deep learning pipeline combining EfficientNetB0, ResNet-50, and CNN-LSTM for spatial, artifact, and temporal deepfake detection, achieving **94%+** accuracy on benchmark datasets.

Chest X-Ray Tuberculosis Classification — Medical image classification pipeline evaluating 5 models (CNN, Decision Tree, Random Forest, KNN, SVM); CNN achieved **92%** accuracy after hyperparameter optimization.
